

Report on 1st NG112 Emergency Communications Plugtest

1. Goal
2. Ng112 Overview
3. Organisation of the event
4. Tests scenarios
5. Results
6. Lesson learnt
7. Next steps

Goal

- EENA published the Next Generation 112 Long Term Definition Document ([here](#)) (March 2013)

- The aim of the event:
 - Independent and joint trial of all components of the 112 communication chain based on Next Generation networks

 - Address Location Based Emergency Call Routing, Policy Based Emergency Call Routing and Next Generation Media Types

 - Have a view on the maturity of the technology

NG112 overview

- External security border for ESInet (Internet)
- Internal isolation border for PSAP
- Has both, firewall and session border controller
- Has functions to block specific call sources (suspicious levels)

- Call routing engine
- Use location information to route the call
- Policy may take into account the state of a PSAP, time, ...

- Routing database used for all calls
- Provides PSAP address to route the call

- Receives all calls with location via the ESInet
- Multimedia capable: voice, video, real-time text, and messaging
- Allows for virtual PSAPs
- Services may reside in a data centre or at the PSAP

- Element to interconnect with legacy originating networks
- Bridge between existing originating network and ESInet
- Interworks location towards ESInet
- Forwards calls to ESRP

- Stores location against some kind of key
- Key can be a network address, phone number, URI ...
- An originating device queries the LIS when it boots, periodically when it moves and before an emergency call
- Returns a PIDF/LO (civic address, geodetic) either by reference or by value

- IP based (Softclient, App)
- VoLTE based (4G mobile)
- UC (Soft Switch, Enterprise Communication)
- PSTN based

Organisation of the event

- The event took place in ETSI premises in Sophia-Antipolis (France)
- One week of testing (14th – 18th of March)
- 19 organisations participated in the event: 14 vendors and 5 observers

Participants

BETA 80 GROUP

Observers

Smart 112 Mobile

Telecommunications Technology Association

- 3 Open Conference Calls in 2015 and from Jan to Mar 2016 bi-weekly preparation conference calls
- For the information management a WIKI set up by ETSI was used
- Creation of the Test Descriptions Document
- Distribution of the Test Descriptions Document some weeks before to the event for comments
- Establishment of the preliminary test schedule
- Organisation of the day: morning test session from 9.00 to 13.00 and in an afternoon test session from 14.00 to 18.00

Organisation of the event

- Updates and invitations to conference calls were distributed via a special mailing list
- Impressions of the Plugtest were captured in a blog set up by ETSI, see <http://www.etsi.org/news-events/events/977-ng112?tab=3>
- Setup of virtual lab by creating VPN tunnels per company
- Pre-testing of basic scenarios prior to the Plugtest

Testing Infrastructure

Test network infrastructure

Internet Access

Two internet accesses (200Mb/s and 100Mb/s)

DHCP

DHCP available only via wifi:
 IPv4: 10.100.60.0 /22
 Default Gateway: 10.100.63.254

FIXED IP

One dedicated 10.100.x.0 /24 network per companies.
 See wiki for details.

DNS

Domain: plugtests.net
 Server: 10.100.0.2

NAT

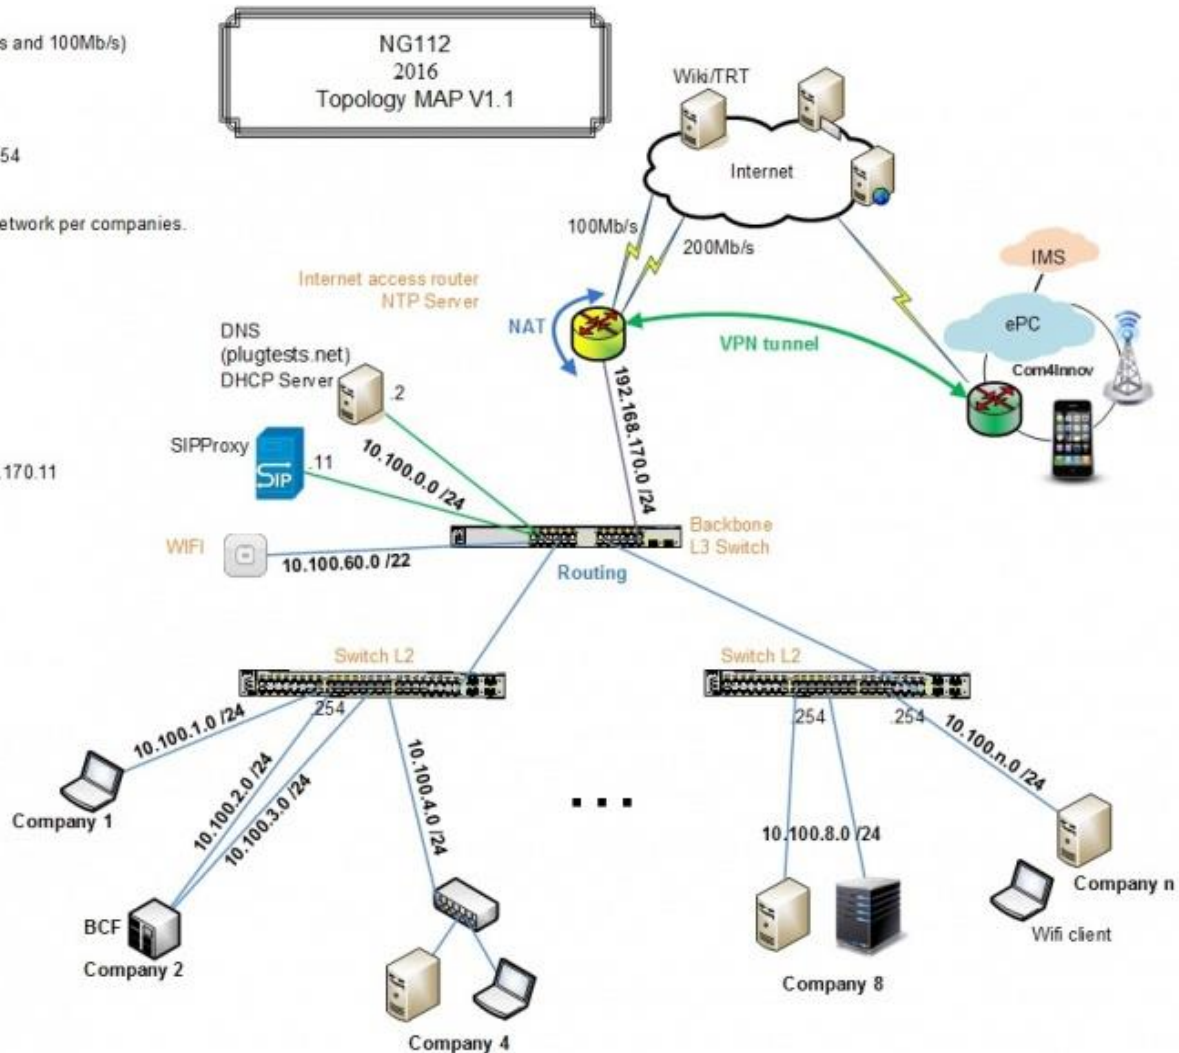

NAT only for internet access

NTP Server:

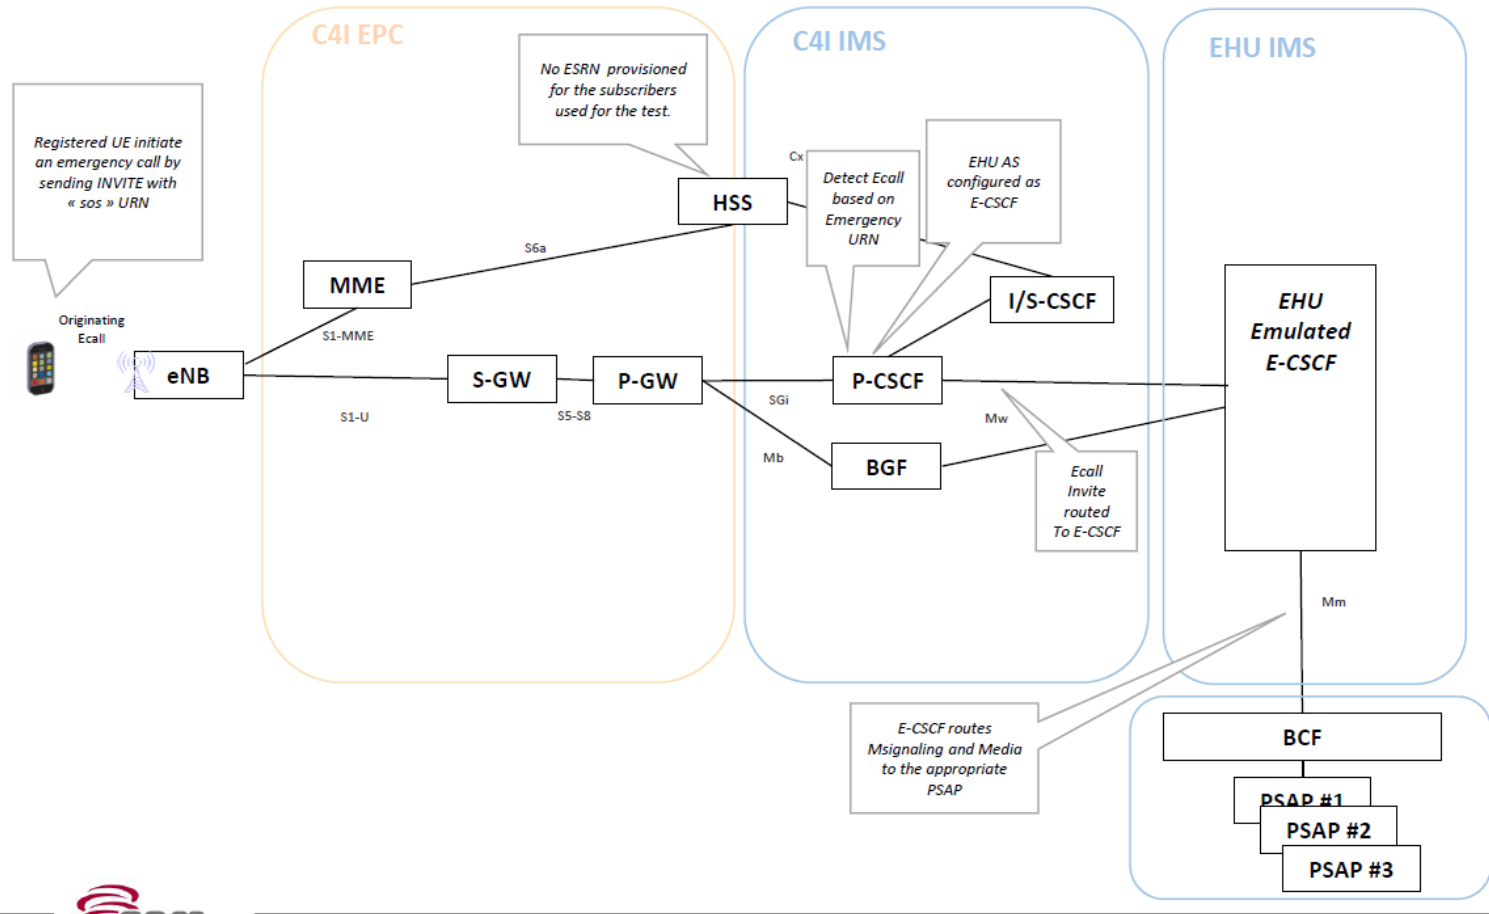

Internet access router: 192.168.170.11

Wifi: 802.11b&g,a,n

SSID: PLUGTESTS
 WPA2 : AES-CCM, TKIP
 Key: PLUGTESTS-EVENT

NG112 Plugtest Configuration - Overview

➤ Test scenarios to be executed by participants

Table 19: RT/LBV/01

Interoperability Test Description			
Identifier	RT/LBV/01		
Test Objective	Verify connectivity between UE (IP) and PSAP with emergency call including NG core services and Location By Value		
Configuration	- CFG_NGCS_IP-1 (5.6)		
References	<ul style="list-style-type: none"> - SIP (n.13) - RTP (n.17) - URN (n.26) - HELD (n.10,n.33,n.35,n.40,n.42) - LoST (n.29,n.30) - LTD (n.1) 		
Applicability	<ul style="list-style-type: none"> - UE_SIP, UE_RTP, UE_G711 (6.2) - BCF_SIP, BCF_RTP, BCF_URN, BCF_NGS, BCF_HELD, BCF_PFL (6.8) - LIS_HELD (6.9) - ESRP_SIP, ESRP_URN, ESRP_LOST, ESRP_PFL, ESRP_NGS (6.10) - ECRF_LOST, ECRF_PFL (6.11) - PSAP_SIP, PSAP_RTP, PSAP_G711, PSAP_URN, PSAP_PFL, PSAP_NGS (6.12) 		
Pre-test conditions	<ul style="list-style-type: none"> - IP connectivity among all elements of the specific scenario - UE configured to register with SIP Proxy/Registrar - SIP Proxy trigger points for emergency call routing (to BCF) - BCF, ESRP trigger points for emergency call routing - ESRP configured to query the ECRF - ECRF configured with correct mapping 		
Test Sequence	Step	Type	Description
	1	stimulus	User dials emergency number (e.g. 112)
	2	check	Dialog creating INVITE received at BCF
	3	check	Location object retrieved from LIS by BCF
	4	check	Dialog creating INVITE (LbyV) received at ESRP
	5	check	LoST request received at ECRF
	6	check	Dialog creating INVITE received at PSAP
	7	check	SIP dialog established
	8	verify	PIDF/LO (LbyV) received at PSAP
	9	verify	Call connected and location displayed

➤ Test Configurations

Figure 13: CFG_NGCS_IP-1 Interfaces

➤ Interoperable Function Statements

Table 7: LIF features

Item	Feature	ID	Ref	Status	Support
1	Does the LIF support PIDF/LO?	LIF_PFL	n.22 n.27		
2	Does the LIF support HELD?	LIF_HELD	n.10 n.33 n.35 n.40 n.42		

Test Configurations

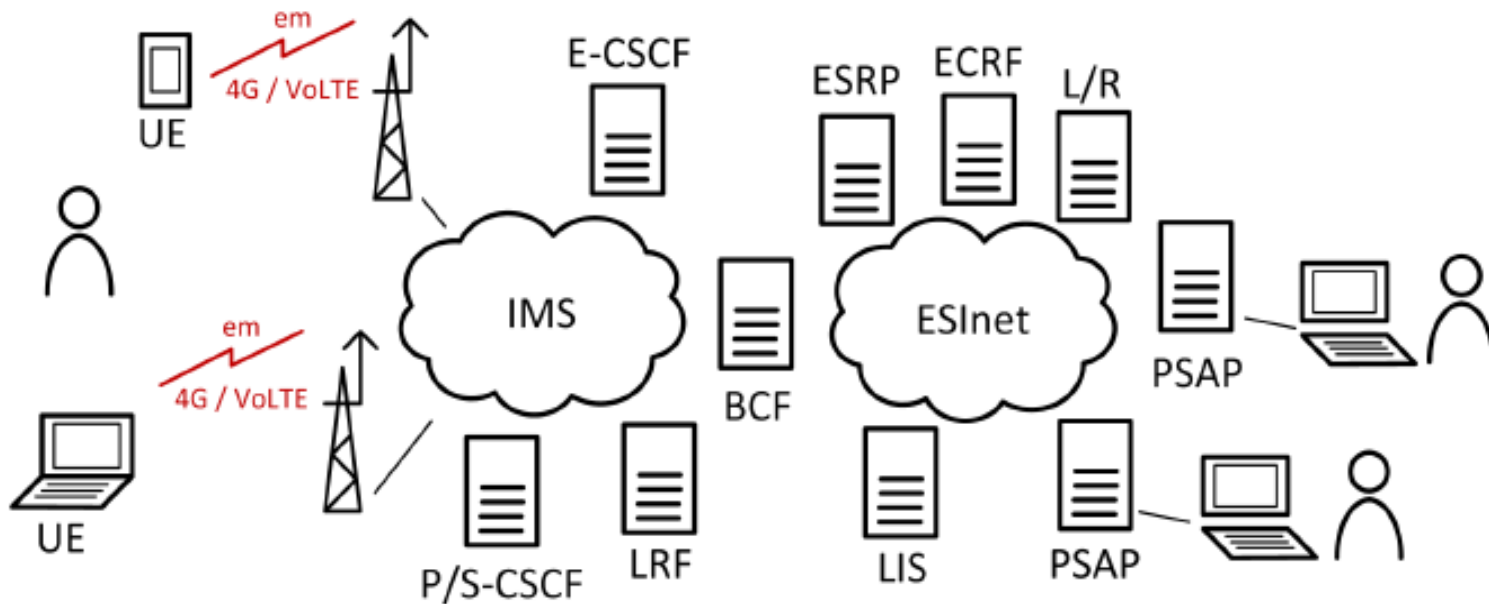

➤ IP-based access to the ESInet

IMS - Test Configuration

➤ IMS - based access to the ESInet

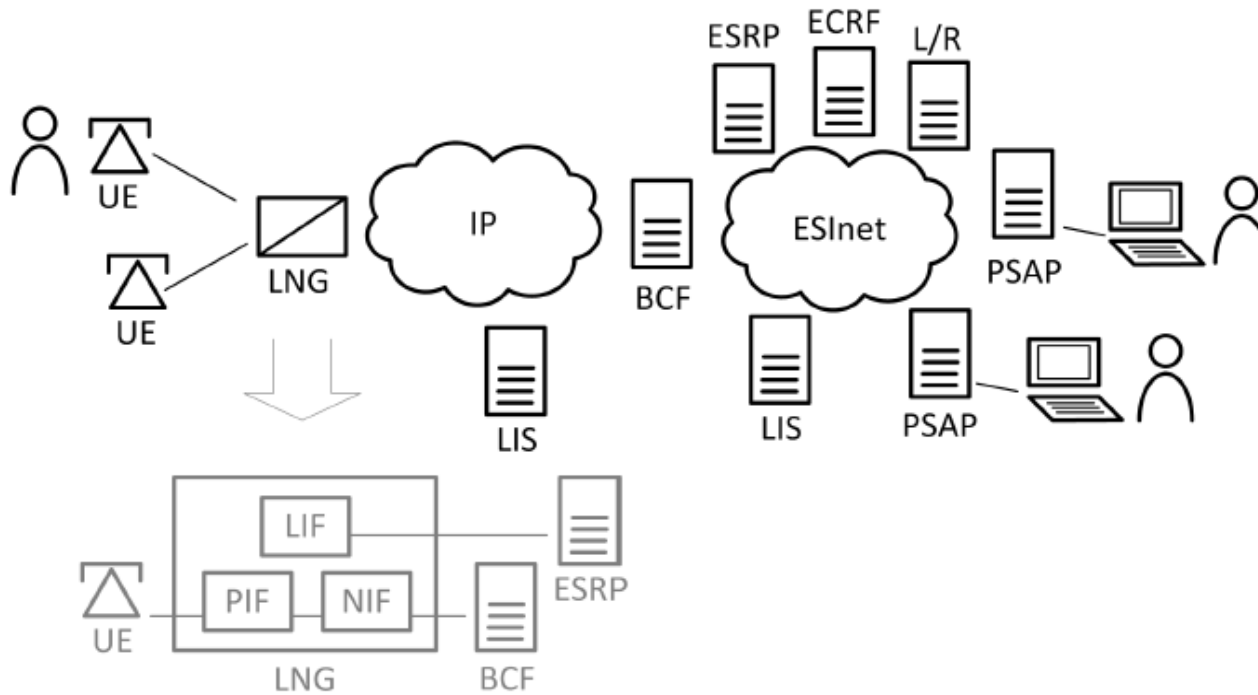

UC - Test Configuration

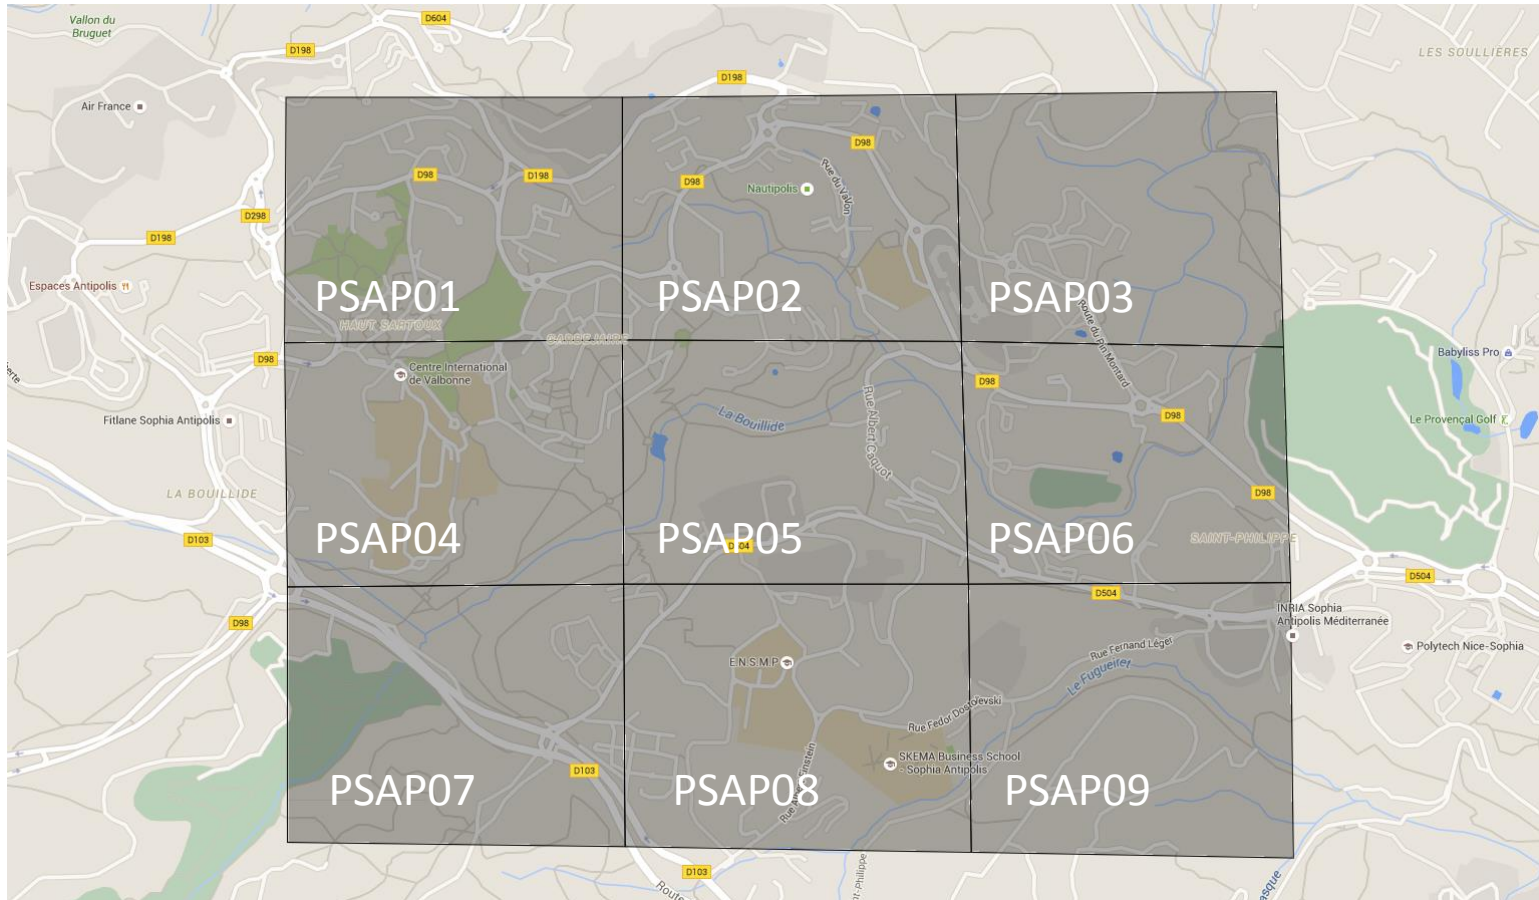

- UC - based access to the ESInet

➤ PSTN - based access to the ESInet

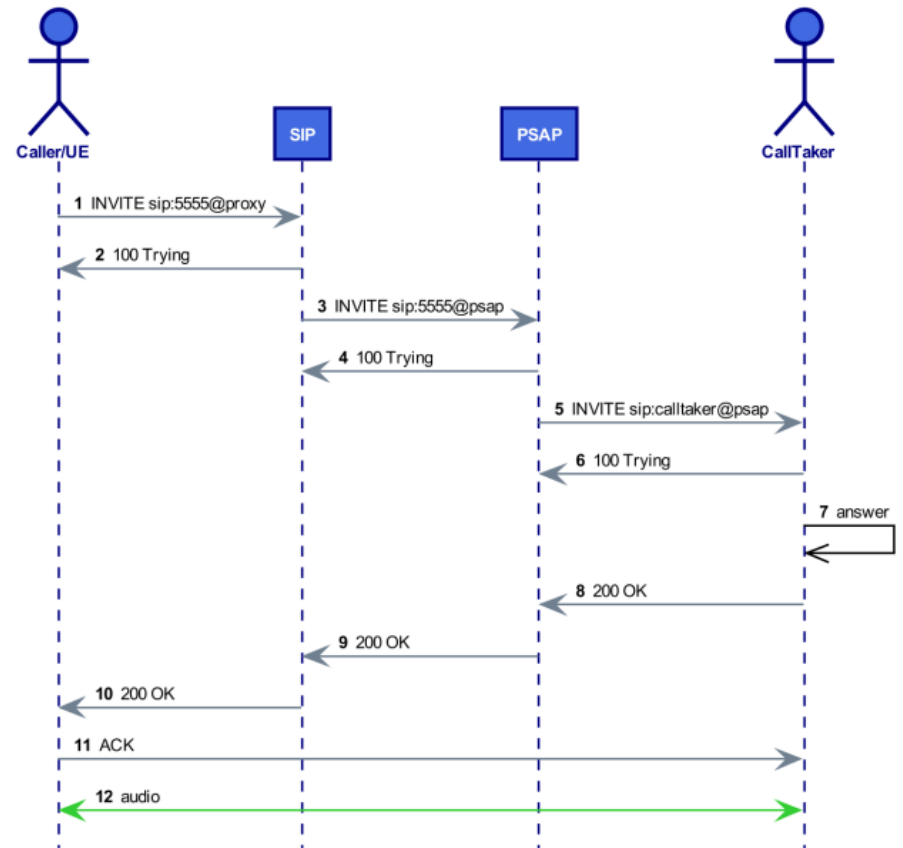

➤ Location-by-Reference and Location-by-Value

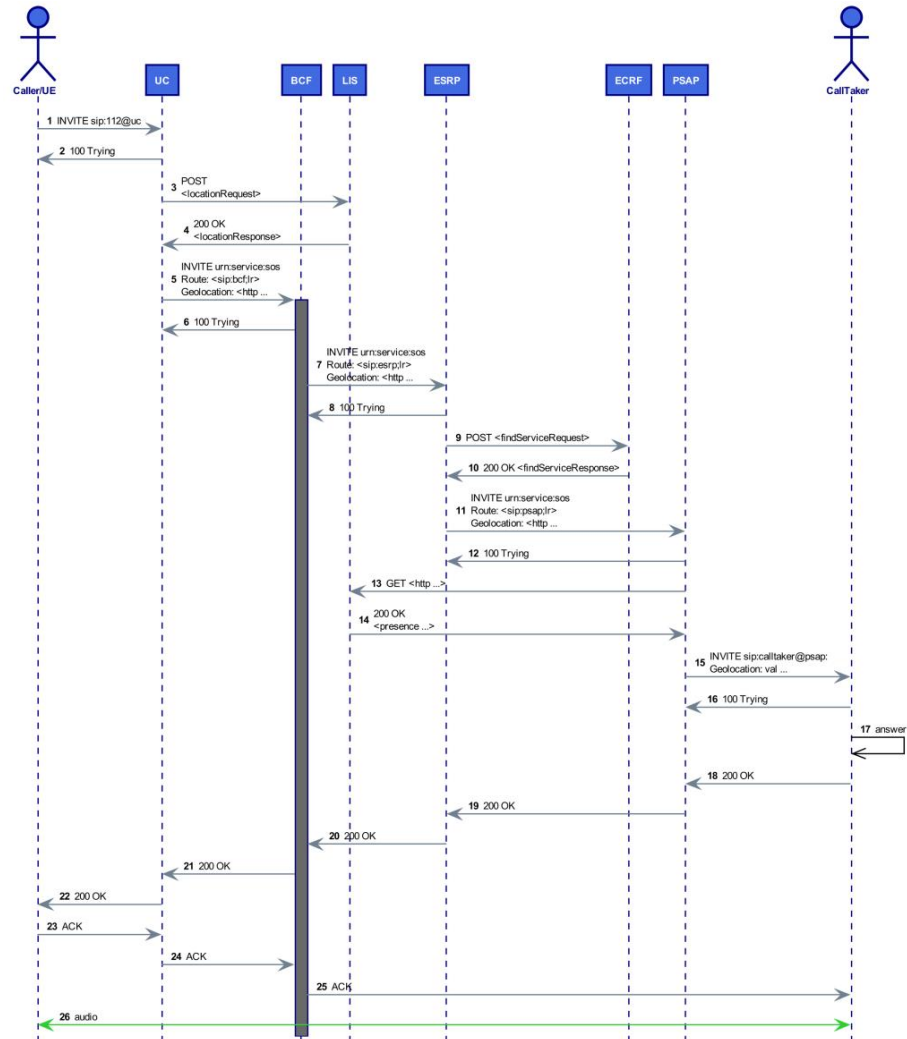

Connectivity Test Cases

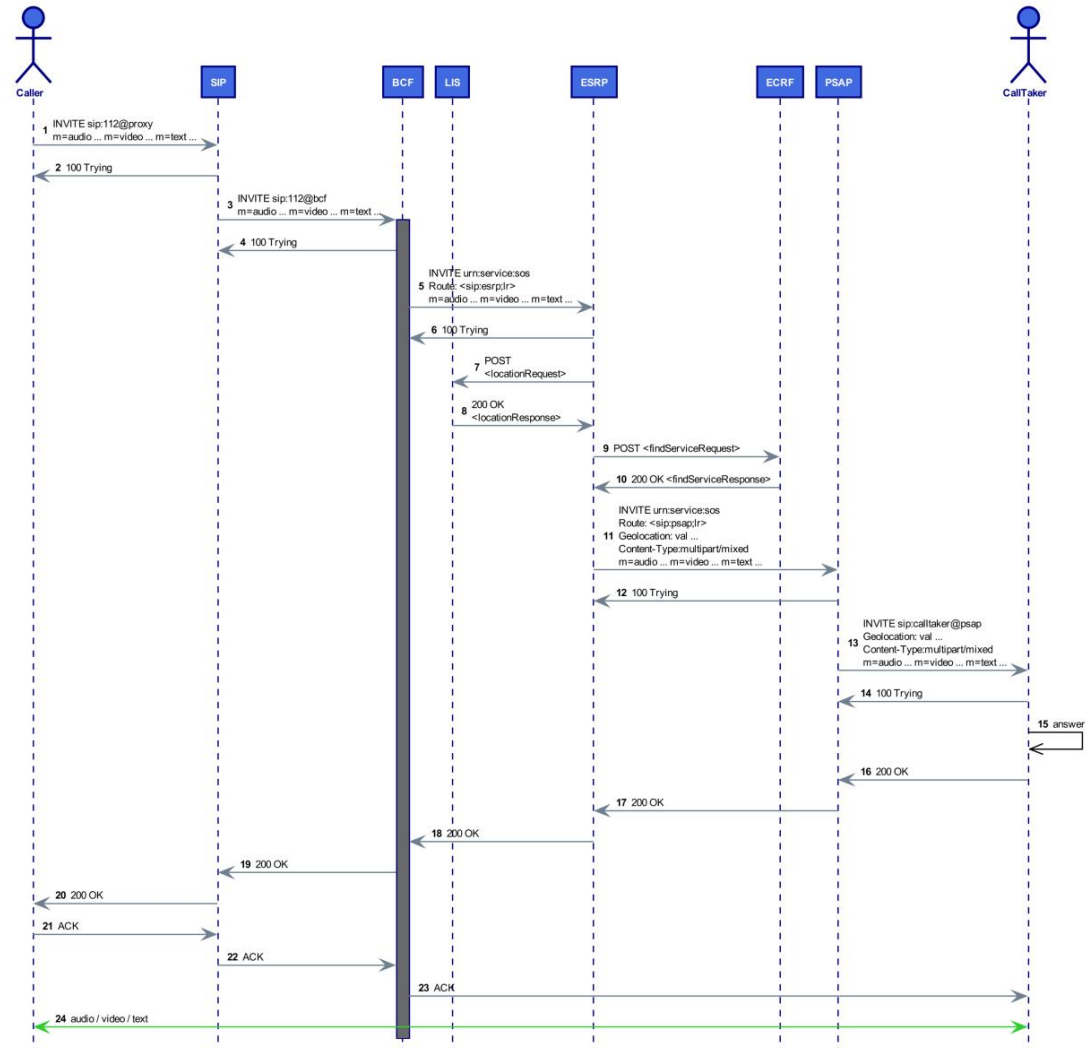

- Tests to verify end-to-end connectivity between UE and PSAP for administrative calls.

- Tests to verify end-to-end connectivity between UE and PSAP for emergency calls including access networks, NG core services and Location.

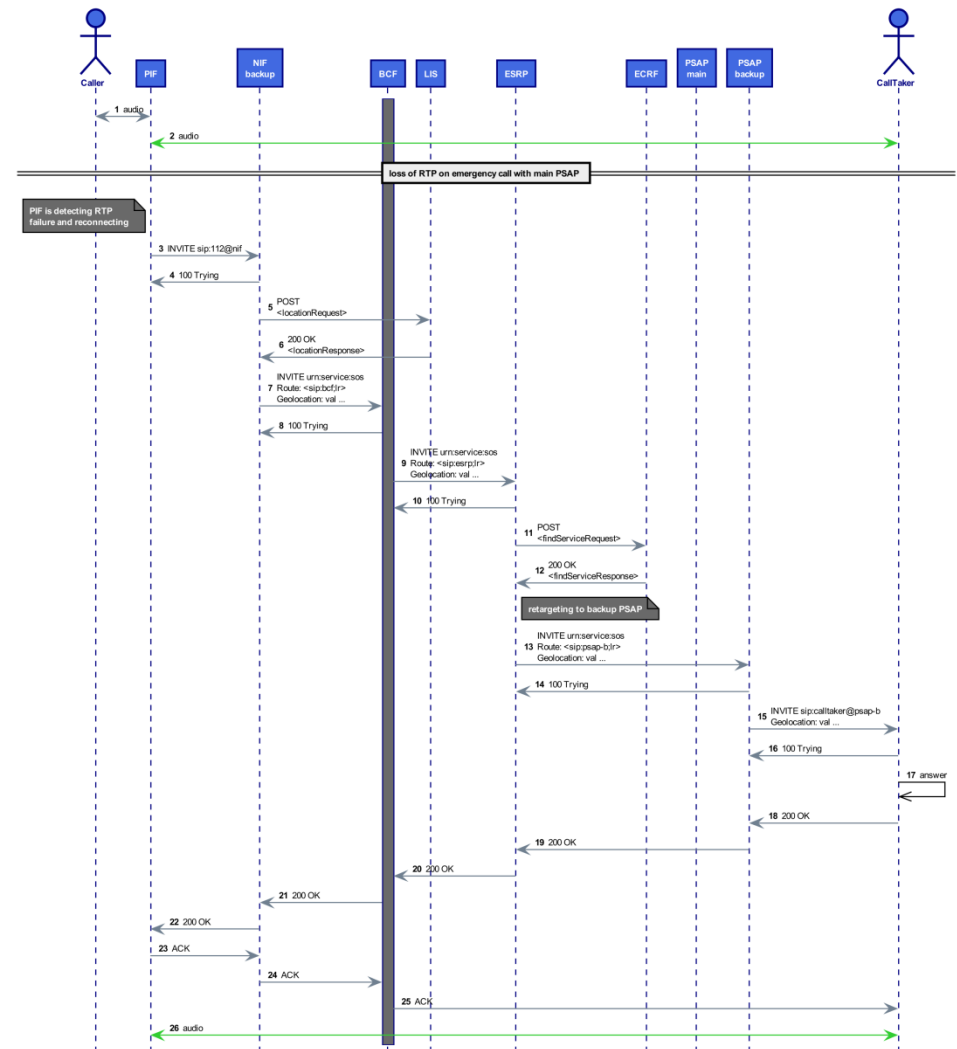

- Tests to verify end-to-end connectivity between UE and PSAP for multimedia emergency calls (audio, video and text) including access networks and NG core services.

Policy Routing Test Cases

- Tests to verify end-to-end connectivity between UE (IP) and PSAP for emergency calls including access networks, NG core services and routing policies (time, queue state, ...).

Results

PSTN-PO/LNG/02	8 (100.0%)	0 (0.0%)	0 (0.0%)	0 (0.0%)	8 (100.0%)	8

- Good range of originating devices
 - VoLTE - IMS, wireline and IP based (UC, webRTC, VoIP Clients / Apps)
- Stable implementations and some prototype implementations attended
- NG112 features that were not yet fully supported
 - service urn, location by reference, media
- More than 100 test pairings, each 1 hour duration, over 4 days of testing
 - The final schedule can be viewed at <https://trt.plugtests.net/tt.php?key=dcd28a05c1758b7194998105df369259937e7129>

Table 4: Results Overview

OK	NO	NA	Execution Rate
99 (97.1%)	3 (2.9%)	26 (20.3%)	102 (79.7%)

Source: 1st NG112 Emergency Services Plugtest Report

- Stable base specifications
- Location based call routing works well
- Total conversation successfully tested
- Interoperability of EENA-based and NENA-based implementations
- Basic Concept of ESI-net successfully verified

Lessons Learnt

- Use pre-defined data sets
 - Data set covering all elements is needed
 - Provide data set before the pre-testing
 - Provided it as csv file
 - Update WIKI during event to capture IP address changes etc
 - Including civic addresses as well as geo information
- Difficult to have an overview of how calls are being routed
 - Visualize call path through elements
- Use a more automated way to test the various routes
- Define in test plan who provides Location Information and how it should be queried
- Be more strict in pre-testing

Lessons Learnt – Border Control Function (BCF)

- Sequential execution of test preferred due to fact that there was only 1 BCF
- Every originating element should be pre-tested with BCF for next Plugtest

- Define more complex routing policies – real world scenarios

- Need to ensure that appropriate PSAP identity is returned when input locations overlap multiple PSAP boundaries
- Need to ensure that PIDF-LO parsing is compliant with the XML schema of RFC5139
- Usage of Forest Guide to select different ECRFs works well

- Make a more formalized pre-testing, e.g. run the basic tests
- Include scenarios with stage-1 and stage-2 PSAPs
- Each element adding location should use a unique location
- Not all features were supported by all PSAPs, e.g. RTT and Location by Reference resolution and service urns

- Consider extending the test plan for the HELD protocol

Lessons Learnt – User Equipment (UE)

- SIP Proxy is required and worked well
- Include relay services and bridges
- Consider testing of webRTC
- SDP is large, 3K buffer not sufficient

Lessons Learnt – Unified Communications (UC)

- Consider testing of mobile users inside UC environment
- Enterprise LIS required for roaming enterprise user
- Consider testing of call-back calls RFC7090
- Ensure that UC and PSAP do support the same video codec

Lessons Learnt – IP Multimedia Subsystem (IMS)

- Include webRTC gateway in EPC infrastructure
- Consider testing of Video, Messaging

Next steps

- Next Plugtest event foreseen for Q1 of 2017 (Date to be confirmed)
- Update test scenarios – add more complex scenarios
- Synchronise with NENA
- Meetings ETSI TC EMTEL (Emergency Telecommunications)
 - Test specification as ETSI standard ?
 - EENA LTD as ETSI standard ?

THANK YOU!
