18 June 2019

# Highlights Cybersecurity Act and policy actions

---

## Moderated by Andreas Mitrakas

- ✔ Pierre Chastanet
- ✔ Sean Estrada
- ✔ Leire Orue-Echevarria
- ✔ Damir Savanovic
- ✔ Speech by Silke Holtmanns
- ✔ Keynote speech by Francois Ambrosini
- ✔ Key use cases of Cloud Computing Certification for successful implementation
- ✔ Impact of certification on Cloud service providers based in the EU; added value for overseas service providers
- ✔ Big gaps to consider include: assurance levels;
- ✔ The impact of a mandatory Cloud certification scheme

## Key highlights 1/2

---

- ✔ Consider jurisdiction issues on the Cloud and align EU legislation across cybersecurity and product legislation
- ✔ The EU internal market provides a unique opportunity to combine high level service offering on the Cloud with a robust legal framework for the free flow of personal and non personal data alike
- ✔ Customer oriented service providers seek to align a sound service with compliance, including compliance as a service
- ✔ The apparent deterrent of multiple cloud certifications schemes can be alleviated by mapping across multiple ones or condensing to a single framework in the EU
- ✔ About a quarter of EU-based businesses operate on the cloud and only 17% use advance services thereof. As security is quoted as the main concern, action is required to shift to an EU model on cloud certification that appeals to users

## Key highlights 2/2

---

The impact of the CSA on SMEs matters; developing a cloud certification scheme means that ca. 70% of requirements is shared across current schemes and an additional 15% is partially so

Public procurement is likely to be influenced by the certification framework

While people and skills certification is beyond the scope of the CSA, developing further these areas is important for the public and private

It is important to build trust and clarity at the requirements level

Vulnerability analysis needs to take into aspects of the market as well of defence needs etc.
