Use case: Testing FlexGrasp.AI Situation and test challenges

Starting situation

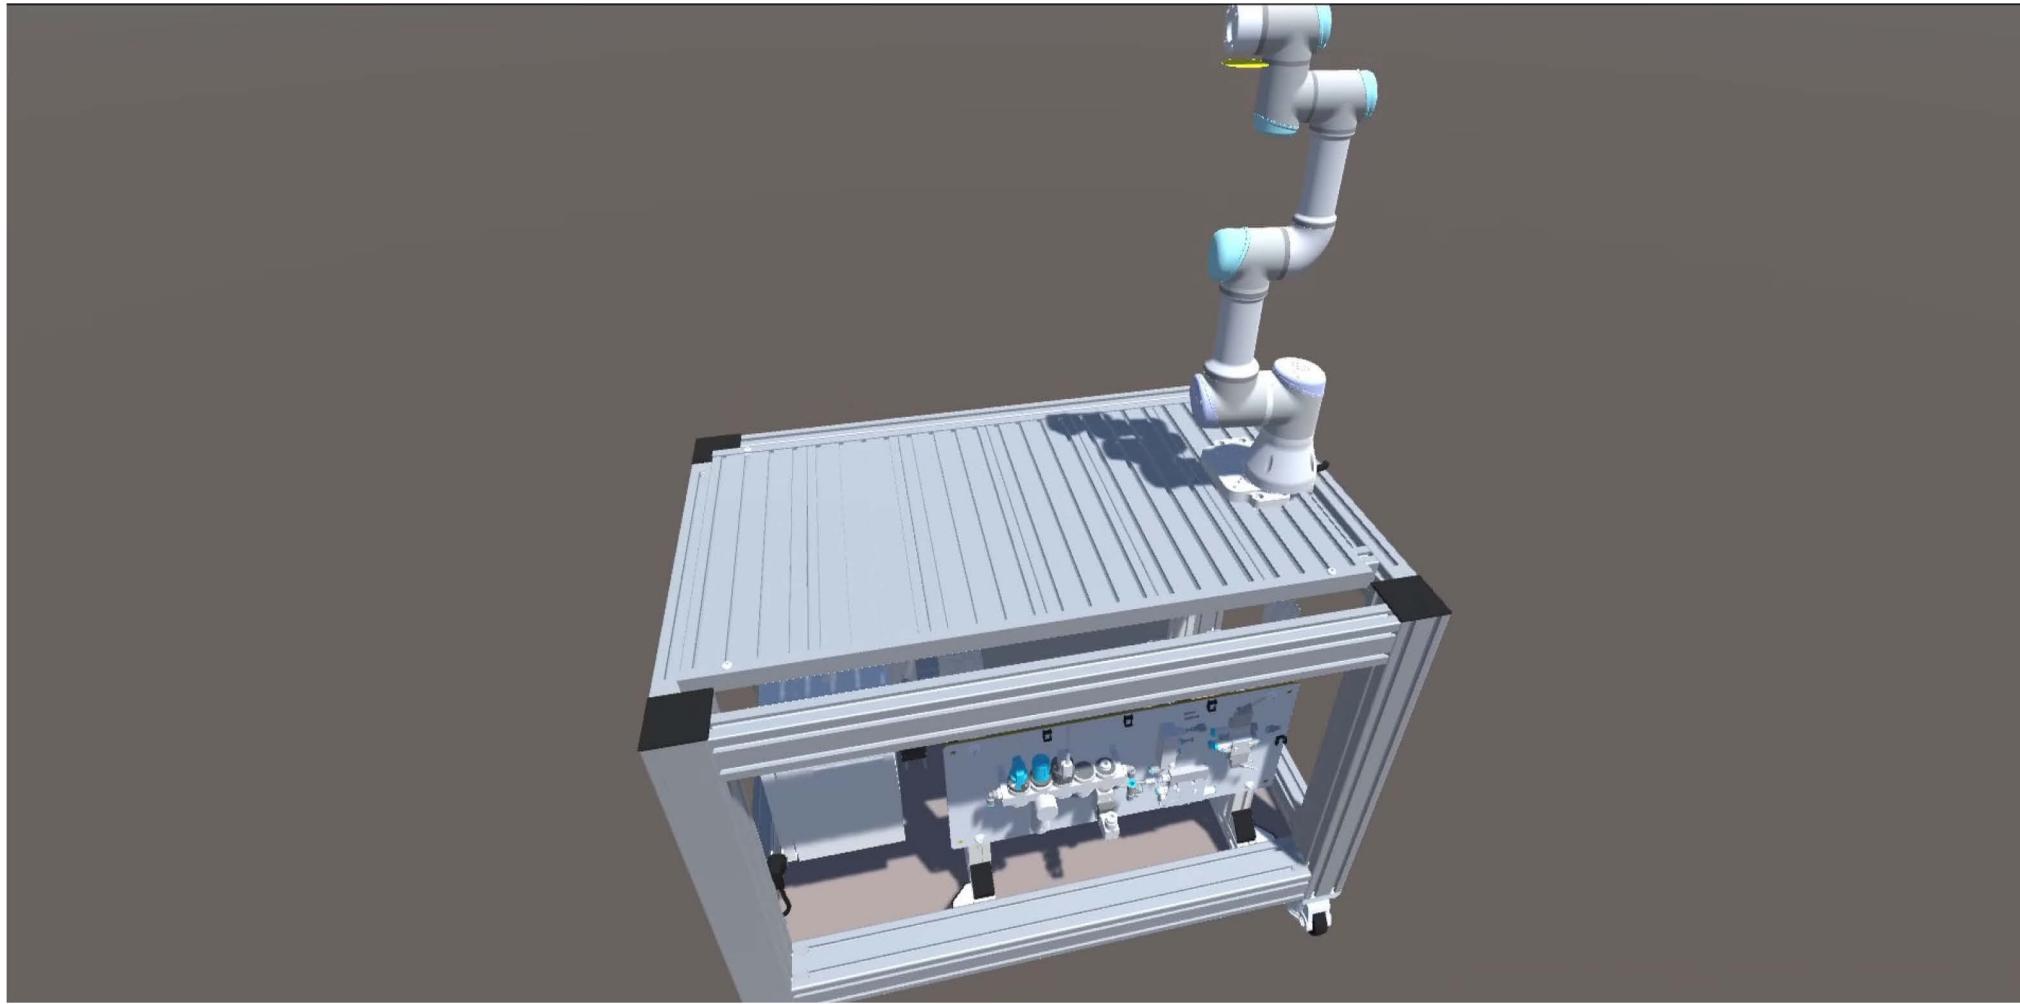

- Robot cells
- No test automation
- Low variance
- Long feedback loops
- Difficult to reproduce
- No test coverage

Test challenges

- Reproduceable test scenarios
- Automate test scenarios
- High scenario variance
- Measurable test coverage
- Run test – independent of HW
- Fast feedback loops

Use case: Testing FlexGrasp.AI The solution

9th UCAAT

Use case: Testing FlexGrasp.AI Results

The following goals have been achieved:

- Reproduceable test scenarios
- Automate test scenarios
- High scenario variance
- Measurable test coverage
- Run test – independent of HW
- Fast feedback loops
- Virtual world too “clean”

Impact:

Increase test efficiency
Increase confidence in the product

Validation of Intelligent Systems (FlexGrasp.AI) Customer Value and Business Impact

9th UCAAT

Customer Value:

Improve product quality
and increase confidence
in delivered product

Business Impact:

Key technology for
testing AI components
