# Motivation

*Debugging hyperparameter misconfigurations of an ML model using causal reasoning*

<https://towardsdatascience.com/the-ultimate-guide-to-debugging-your-machine-learning-models-103dc0f9e421>

# Motivating Example

## Misconfiguration

```
model = RandomForestClassifier(bootstrap=True,
                               max_depth=2,
                               max_features='auto',
                               min_samples_leaf=1,
                               min_samples_split=2,
                               n_estimators=30,
                               criterion = 'gini',
                               random_state=42)
```

Accuracy: 0.60

New User Hyperparameter Grid

```
param_grid = {
    "bootstrap": [True, False],
    "max_depth": np.arange(10, 110, 10),
    "max_features": np.arange(10, 500, 50),
}
"min_samples_leaf": np.arange(1, 5),
"min_samples_split": np.arange(2, 4),
"n_estimators": np.arange(100, 500, 50),
"criterion": ['gini', 'entropy']
```

*Can be costly/time-consuming*

## Hyperparameter Optimization

```
model = RandomForestClassifier(bootstrap=False,
                               max_depth=10,
                               max_features='auto',
                               min_samples_leaf=1,
                               min_samples_split=2,
                               n_estimators=400,
                               criterion = 'gini',
                               random_state=42)
```

Accuracy: 0.88

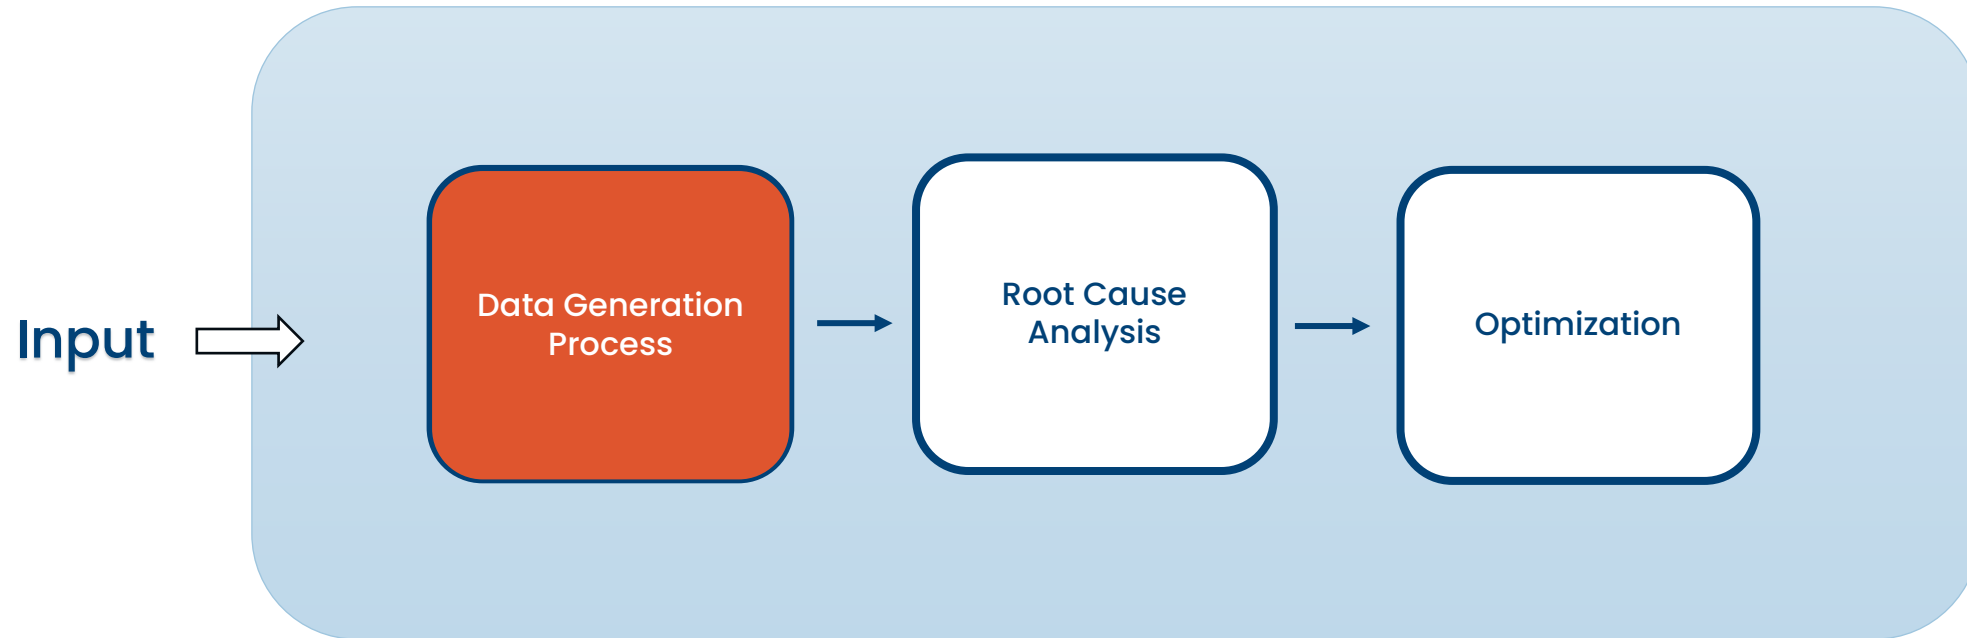

## Debugging

- Root cause
- Reduce the search space
- Interpretability/Explainability

# Proposed Framework (Overview)

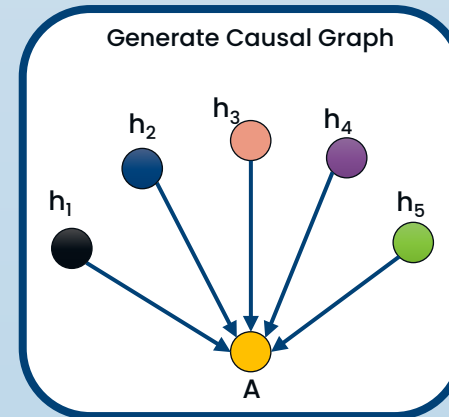

# Proposed Framework (Data Generation Process)

## Input

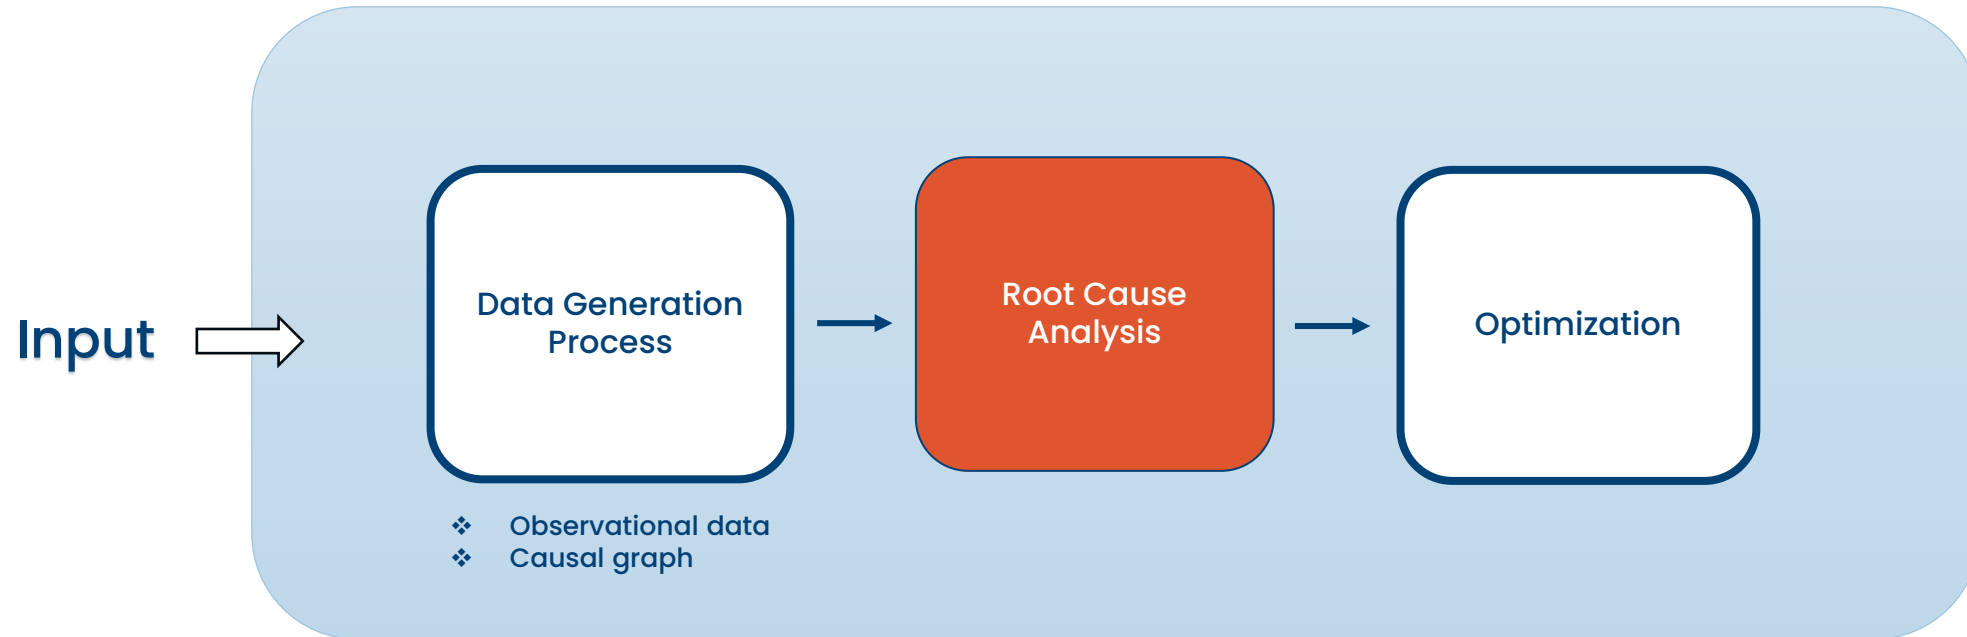

- ❖ Dataset
- ❖ Learning Algorithm
- ❖ User Hyperparameter Grid
- ❖ Number of Iterations

bootstrap	criterion	max_depth	max_features	min_samples_leaf	min_samples_split	n_estimators	accuracy
TRUE	entropy	20	0	9	9	470	84
TRUE	entropy	40	1	10	8	150	62
FALSE	gini	50	0	9	10	180	85
TRUE	entropy	30	0	10	3	250	73

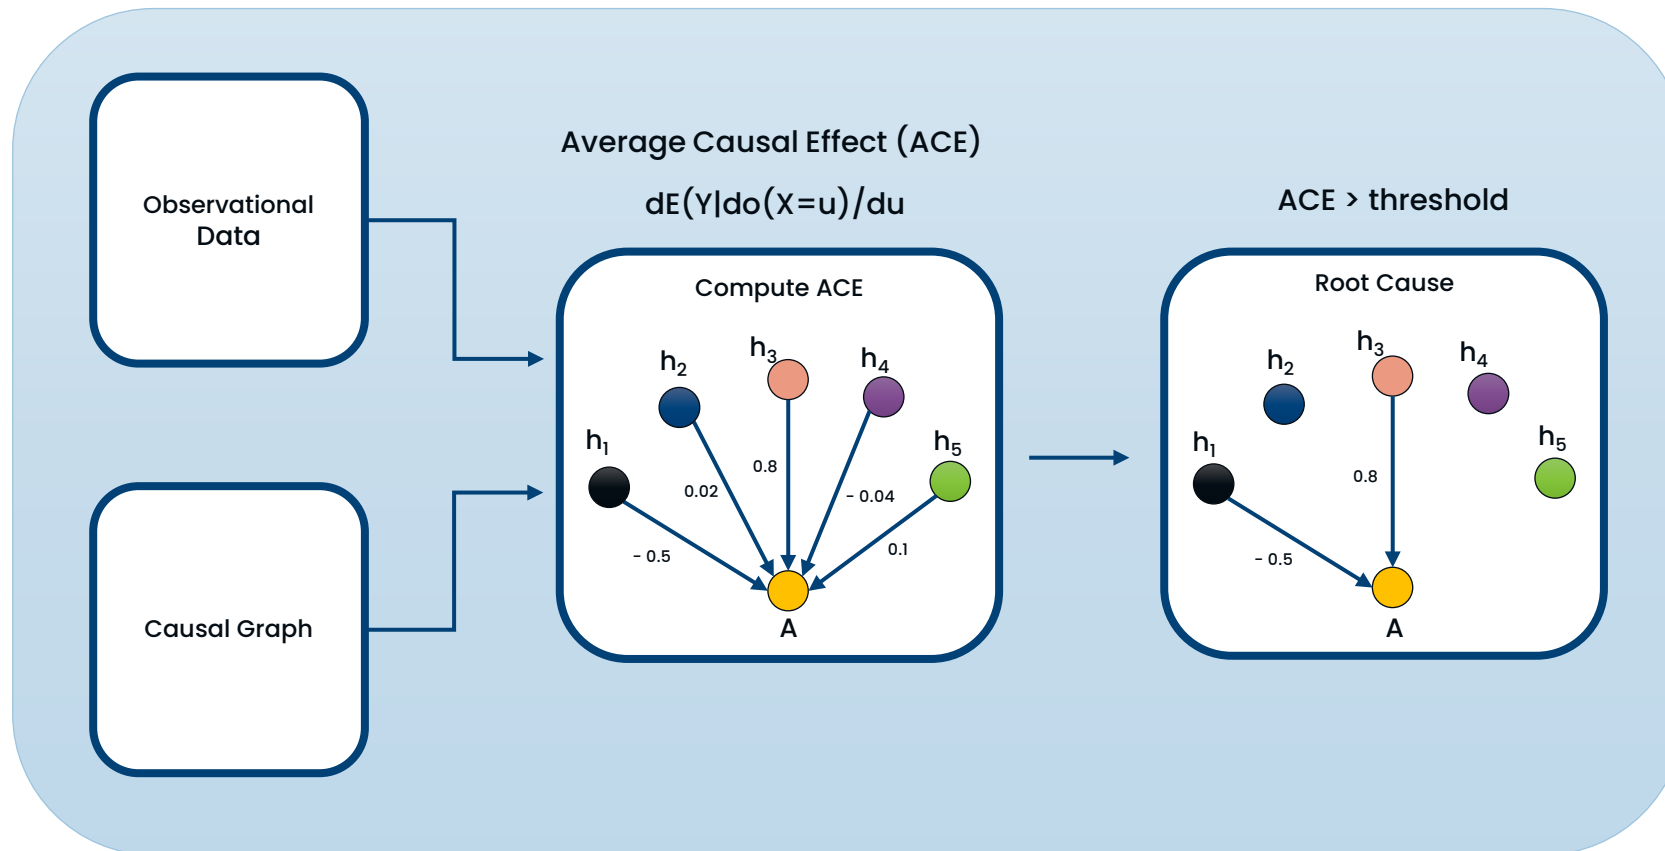

# Proposed Framework

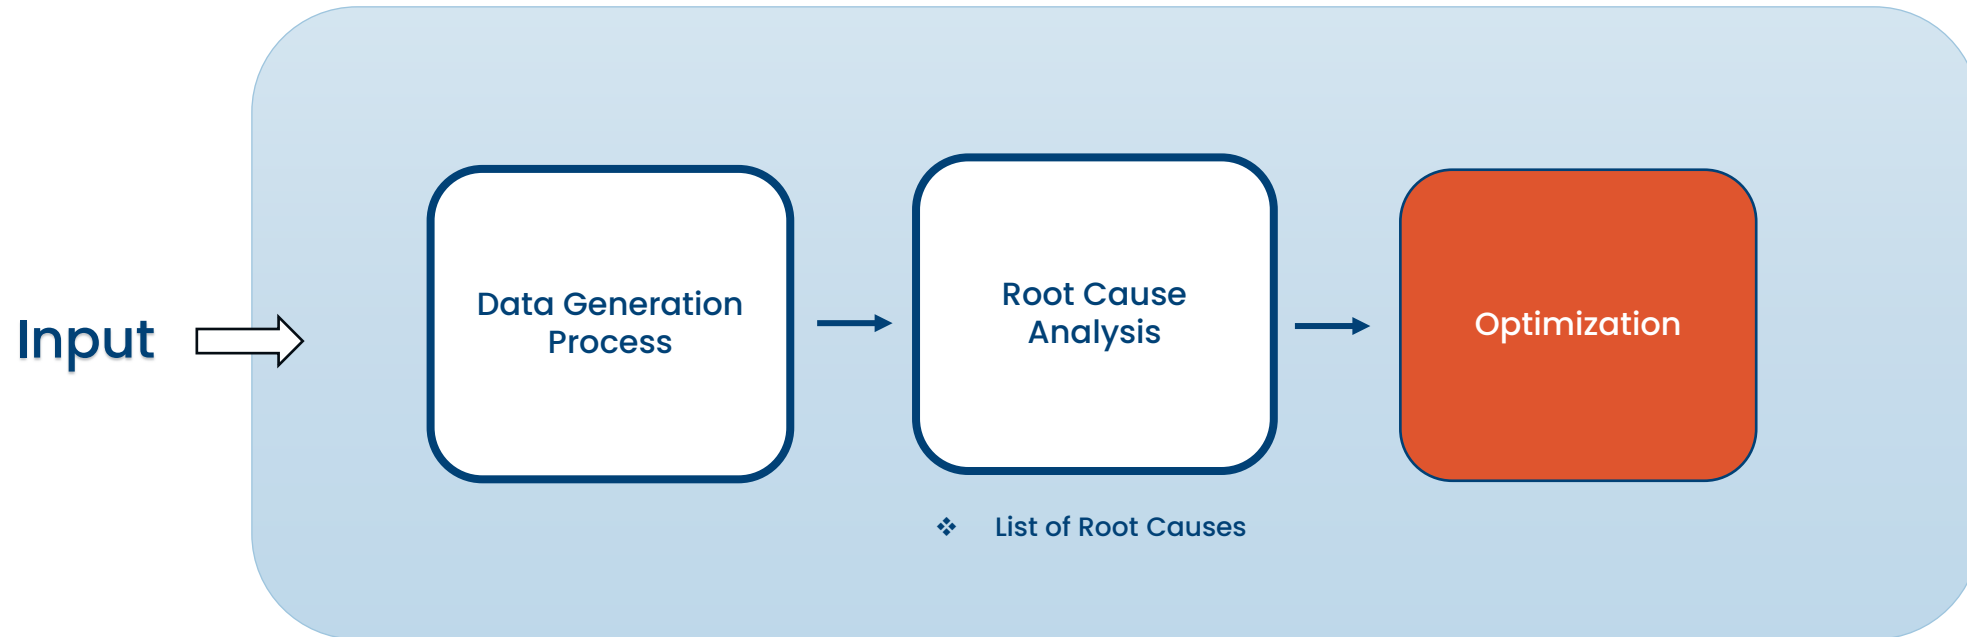

# Proposed Framework (Root Cause Analysis)

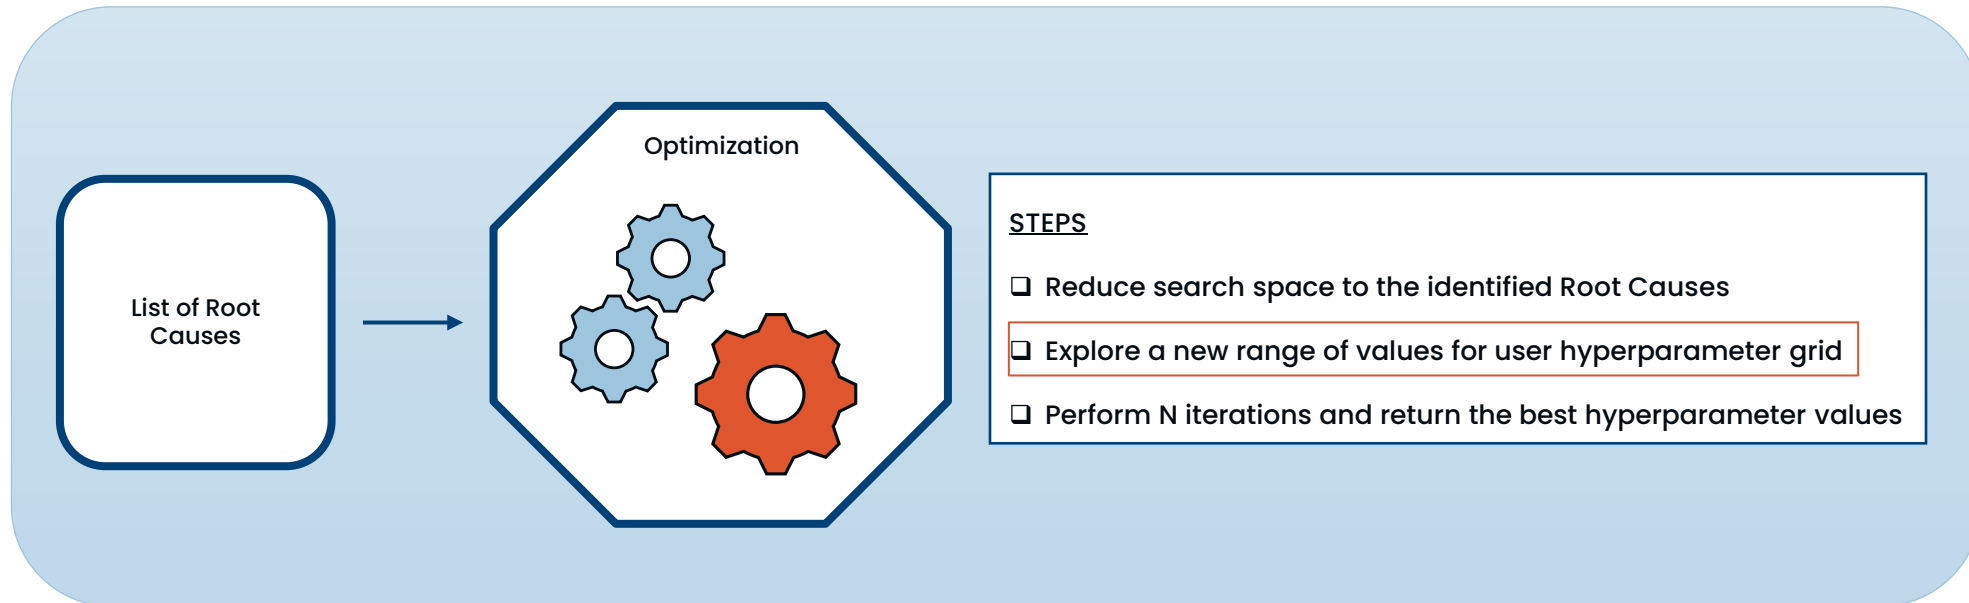

- TAKE-AWAY
- Identify the root causes
  - Infer the tuning direction

# Proposed Framework

# Proposed Framework (Optimization)

# Future Works

- ❑ Investigate efficient ways of selecting a new range of hyperparameter values
- ❑ Evaluate the performance of our framework against existing approaches
- ❑ Extend our framework to include data debugging using causal reasoning

## ML DEBUGGER

Hyperparameter  
Debugging

Data  
Debugging

# Conclusion

- ❑ We argued that debugging should be performed before optimization.
- ❑ Our framework can help in:
  - ❑ Identifying the root cause of a hyperparameter misconfiguration.
  - ❑ Reducing the cost involved in hyperparameter optimization and improve on its result.
  - ❑ Making the performance of an ML model interpretable/explainable.

# Any questions?
